

Ethernet in the First Mile

1

Customer site

Either a 2 or 4 pair service is installed into the building. The speeds delivered are symmetrical i.e. the same downstream and upstream. There is an option of a managed router if required.

2

Exchange connection

An EFM card is installed by TalkTalk Business into the MSAN at the exchange. The lead time is reduced if the EFM card is already present.

3

Connect to the network

The exchange is connected to our NGN allowing you to choose the circuit to be delivered into a Partners Layer 2 Interconnect, as part of an MPLS IPVPN solution or as an Internet Access circuit.
